Q.) Given N array elements and Q queries. ^{no. of queries} for each query-

- calculate sum of all elements in range $[L, R]$

Note $\rightarrow L$ and R are indices such that $L \leq R$. $1 \leq N, Q \leq 10^5$

arr[10] : $\begin{bmatrix} -3 & 6 & 2 & 4 & 5 & 2 & 8 & -9 & 3 & 1 \end{bmatrix}$
 $\begin{matrix} 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \end{matrix}$

Queries = 5

ans.

L	R	
4	8	9
3	7	10
1	3	12
0	4	14
7	7	-9

idea \rightarrow for every query, calculate the sum. [iterate from l to r].

pseudo-code:

```
void fun(arr, N) {  
    q  $\rightarrow$  take input [no. of queries]  
    while (q > 0) {  
        q --  
        l, r  $\rightarrow$  take input  
        sum  $\rightarrow$  0  
        for (i = l; i <= r; i++) {  
            sum += arr[i]  
        }  
        print(sum);  
    }  
}
```

T.C $\rightarrow O(N * Q)$

S.L $\rightarrow O(1)$

{ T.L.E }

Q) Given Indian Cricket Team scores for first 10 overs of batting. After every over, total score is given as :

Overs :	1	2	3	4	5	6	7	8	9	10
Score-board :	{ 2	8	14	29	31	49	65	79	88	97 }

cumulative sum

Total runs scored in last over : $97 - 88 = 9$

$$\text{score}[10] - \text{score}[9]$$

Q) Total runs scored in 7th over : $65 - 49 = 16$

$$\text{score}[7] - \text{score}[6]$$

Q) Total runs scored in overs 6th to 10th : $97 - 31 = 66$

$$\text{score}[10] - \text{score}[6-1]$$

Q) Total runs scored in overs 3rd to 6th : $49 - 8 = 41$

$$\text{score}[6] - \text{score}[3-1]$$

Total runs from ith over to jth over $\rightarrow \text{score}[j] - \text{score}[i-1]$

idea. \Rightarrow store cumulative sum / prefix sum

arr[10]: $\begin{bmatrix} -3 & 6 & 2 & 4 & 5 & 2 & 8 & -9 & 3 & 1 \end{bmatrix}$
_{0 1 2 3 4 5 6 7 8 9}

psum[10]: $\begin{bmatrix} -3 & 3 & 5 & 9 & 14 & 16 & 24 & 15 & 18 & 19 \end{bmatrix}$
_{0 1 2 3 4 5 6 7 8 9}

Queries - 5 ans.

L R

4 8 \rightarrow psum[8] - psum[4-1] = 18 - 9 = 9

3 7 \rightarrow psum[7] - psum[3-1] = 15 - 5 = 10

1 3 \rightarrow psum[3] - psum[1-1] = 9 - (-3) = 12

7 7 \rightarrow psum[7] - psum[7-1] = 15 - (24) = -9

0 4 \rightarrow psum[4] = 14.

$\left[\begin{array}{l} \underline{l} \quad \underline{r} \rightarrow \text{psum}[r] - \text{psum}[l-1] \end{array} \right]$

$\left[\text{psum}[i] \rightarrow \text{Sum of all the elements from index 0 to } i. \right]$

How to construct prefix array.

{ 3, -2, 4, 5, 6 }.

1 2 3 4

$$pSum[0] = arr[0] = 3$$

$$pSum[1] = arr[0] + arr[1]$$

$$pSum[1] = pSum[0] + arr[1]$$

$$pSum[2] = arr[0] + arr[1] + arr[2]$$

$$pSum[2] = pSum[1] + arr[2]$$

$$pSum[3] = arr[0] + arr[1] + arr[2] + arr[3]$$

$$pSum[3] = pSum[2] + arr[3]$$

↓

$$pSum[i] = pSum[i-1] + arr[i]$$

pseudo-code -

$$pSum[0] = arr[0]$$

```
for ( i = 1 ; i < N ; i++) {  
    pSum[i] = pSum[i-1] + arr[i]  
}
```

$$T.C \rightarrow O(N)$$

pseudo-code for Q1

```
void fun ( arr, N) {
```

```
    psum[N];
```

```
    psum[0] = arr[0]
```

```
    for ( i = 1 ; i < N ; i++) {  
        psum[i] = psum[i-1] + arr[i]  
    }
```

} N

```
    q → take input
```

```
    while ( q > 0 ) {
```

```
        q -- 1
```

```
        l, r → take input.
```

```
        if ( l == 0 ) {
```

```
            print ( psum[r] );
```

```
        } else {
```

```
            print ( psum[r] - psum[l-1] );
```

```
        }
```

```
    }
```

} Q

```
}
```

T.C → $O(N+Q)$

S.C → $O(N)$

Can we modify the array?

arr[10] : $\begin{bmatrix} -3 & 6 & 2 & 4 & 5 & 2 & 8 & -9 & 3 & 1 \end{bmatrix}$
_{0 1 2 3 4 5 6 7 8 9}

↓

arr[10] : $\begin{bmatrix} -3 & 3 & 5 & 9 & 14 & 16 & 24 & 15 & 18 & 19 \end{bmatrix}$

```
for ( i = 1 ; i < N ; i++) {  
    arr[i] = arr[i-1] + arr[i];  
}
```

Advantage : SC is optimised.

Dis-advantage : initial elements will be lost.

Break 8:10 → 8:20

Equilibrium Index.

Amazon
Adobe
Hike

Q. Given N array elements, count no of equilibrium index.

An index i is said to be equilibrium index if :

Sum of all elements
on left of i th index

=

Sum of all elements
on right of i th index

Note : if $i = 0$, leftSum = 0
if $i = N-1$, rightSum = 0

$$\begin{aligned} \text{sum}[i, j] &= \text{psum}[j] - \text{psum}[i-1] \\ &= \text{psum}[N-1] - \text{psum}[i] \end{aligned}$$

$$\begin{aligned} \text{sum}[0, i-1] &= \text{sum}[i+1, N-1] \\ \text{psum}[i-1] &= \text{psum}[N-1] - \text{psum}[i] \end{aligned}$$

Eg: arr \rightarrow { -3, 2, 4, -1 }

leftSum \rightarrow 0, -3, -1, 3
rightSum \rightarrow 5, 3, -1, 0

(ans = 1)
↑

 $S.C \rightarrow O(N)$

Q) Given N array elements and Q queries.

For each query l to r. Find count of even numbers in given range.

Eg: arr[10] : { 2 4 3 7 9 8 6 5 4 9 }
 0 1 2 3 4 5 6 7 8 9

Queries=3

ans.

<u>l</u>	<u>r</u>	
4	8	<u>3</u>
3	9	<u>3</u>
0	4	<u>2</u>

Brute Force

For every query, iterate from l to r and find the count of even no's.

pseudo-code

```
void fun ( arr, N ) {  
    q → take input.  
    while ( q > 0 ) {  
        q -- 1  
        l, r → take input, count = 0  
        for ( i = l ; i <= r ; i++ ) {  
            if ( arr[i] % 2 == 0 ) { count += 1 }  
        }  
        print ( count );  
    }  
}
```

T.C → $O(N*Q)$
S.C → $O(1)$

Optimisation :

arr[10] : { 2, 4, 3, 7, 9, 8, 6, 5, 4, 9 }

even odd
↓ ↓
1 0

arr[10] : { 1, 1, 0, 0, 0, 1, 1, 0, 1, 0 }

psum. : { 1, 2, 2, 2, 2, 3, 4, 4, 5, 5 }

$$\left[\begin{array}{l} \text{Count of even no's} \\ \text{from } l \text{ to } r \end{array} = \text{psum}[r] - \text{psum}[l-1] \right]$$

$\underline{l=0}, \underline{r=4}$ $\text{psum}[4] - \cancel{\text{psum}[0-1]}^0$

pseudo-code.

```
void fun(arr, N) {  
    for (i = 0; i < N; i++) {  
        if (arr[i] % 2 == 0) {  
            arr[i] = 1  
        }  
        else {  
            arr[i] = 0  
        }  
    }  
    for (i = 1; i < N; i++) {  
        arr[i] = arr[i-1] + arr[i]  
    }  
}
```

q → take input

while (q > 0) {

q -- 1 ;
